

Space for notes:

A4F Safe II+

...I have to stay outside...

Not only the casing is solid. The system is protected against viruses by hardware.

The carefree computer, resistant for sure.

:

: On the right side of the system is the switch combi. This can be interrogated by software and may be used to trigger any event. In the reference implementation one switch is used to start a complete Windows additionally.

Side view: The safety lock is clearly visible on the left side. If the device has been "locked" with the safe-security-key, the entire operating system and the software installed on the *medium with hardware write protection* is 100% protected against any modification (accidental erasure, malicious software, any type of virus, ...).

Even for the most experienced hackers or other criminal users (even with full administrative privileges) the operating system or the installed software can not be modified if the write protection is activated (in simple words, the device has been "locked" with the safe-security-key). In any case after a reboot the original state is back again.

To clarify the size ratios of the system two coins (1 Euro & 1 Dollar) have been placed on top of it.
